

Vim/src/autocmd.c

```
1. static void
2. autocmd_add_or_delete(typval_T *argvars, typval_T *rettv, int delete)
3. {
    .
    .
    .
223. if (pat != NULL) not delete keyword.
224. {
225.     if (do_autocmd_event(event, pat, once, nested, cmd,
226.         delete ← replace, group, 0) == FAIL)
227.     {
228.         retval = VVAL_FALSE;
229.         break;
230.     }
231. }
```

This expression points to memory that has been freed.

This `delete` is a variable, not delete keyword.
